

Brazil City Fire Department fire department will be testing and flushing hydrants in areas of Brazil on the following dates. This testing is done to ensure hydrants are in working order and to measure the amount of water availability is documented by recording pressures and gallons per minute. This also eliminates health hazards that comes from stagnate portions of the water system such as lines that connect hydrants to the main grid system. Unfortunately this testing may also effect the water residents get at there homes. The large volume of water that rush thought the lines may cause hard elements of the water to discolor laundry residents may be washing on days testing is being done in the area. This list is provided to the news media to inform residents when testing is being done in the area and why the water may be discolored for this short period.

List is also provided on the City's web page

13MAY07 (late night)

#535 to #563

Downtown area

14MAY07

#301 to #325
